

## ***EQi - D10K Intelligent Brushless Controller***

### **TCS MICROPUMPS: EQi**

*Suitable for use with all versions of the D10k MicroPump*  
(Patents Pending, Quality Assured ISO 9001, RoHS compliant)

#### ***INTRODUCTION***

The TCS EQi control board is highly efficient, small and lightweight device and can be quickly and easily installed into the smallest spaces, in a vast range of laboratory, prototype and production equipment.

The EQi will accept an input voltage of up to 30v DC. The output from the EQi can be controlled by either the on board speed control pot or from an external 0-5v input. The speed of the pump is 'Governed' above 12v to maintain a constant flow as the back pressure increases. This provides a flatter pressure/flow curve. Below 12v the pump speed will decrease as the voltage is lowered.

#### ***ELECTRICAL CONNECTION***

Voltage: up to 30 DC  
Input: 2 screw terminal : UP to 30v/GND  
Output: 3 screw terminal : Phase XYZ

1. Connect the 3 wires of the Micropump to the 3 screw terminals marked 'Phase XYZ'.
2. Connect the Input power to the 2 screw terminals marked 'Up to 30V (+) & GND (-)'.
3. Set Jumper plug for either inboard speed control or external 0-5v control. NOTE: if using the external 0-5 you will need to use the supplied lead to connect to the 3 pin header next to the input power terminals. The RED wire on the lead must go next to input power terminals. Then connect you external 0-5V to the GND (-) and 0-5v (+) wires.

Always make all cable connections before powering the EQi.

TCS suggest that you begin testing with a supply voltage of 12v.

It is advised to use a 'always live' supply voltage as the EQi is instant start. If a slow starting power supply is used it may cause the EQi not to start. If this is the case then turn on PSU first and then connect the EQi.

If using the 0-5V control do not exceed the maximum 5v and always apply the 0-5v after powering up the main input voltage. If using the on board pot control you will notice that the pot does not have stops. This is to protect from pot damage. You can hear the increase/decrease of pump speed as you turn the pot. In both control options you will need 50% setting to start the pump. Do not leave the 0-5 powered if using the pot control, this will damage the EQi.

# EQi - D10K Intelligent Brushless Controller

## Maximum Operating Pressure

D10K- 550 Millibar (0.55 Bar) (8psi)

## CAUTION

Do not exceed the maximum operating pressure for your pump  
Do not exceed the maximum operating current draw of **1.5 amps**.  
Exceeding these limits may cause damage to the Micropump.
